.PAGE   "How to Read the Microcode -- Formats & Constructs"

;(1)    Field Definitions
;       These occur at the beginning of the listing, in the source file
; DEF.MIC.  They have the form:
;       SYMBOL/=J,K,L,M
;       The first parameter (J) is meaningful only when "D" is specified
; as the default mechanism, and in that case, gives the default value of
; the field in hexadecimal.
;       The second parameter (K) gives the field size in (decimal) number
; of bits.
;       The third parameter (L) gives the field position in decimal
; as the bit number of the rightmost bit of the field.  Bits are numbered
; from 0 on the right.
;       The fourth parameter (M) is optional, and selects a default
; mechanism for the field.  The legal values of this parameter are the
; characters "D", or "+".
;         "D" means J is the default value of the field if no explicit
;       value is specified.
;         "+" is used on the jump address field to specify that the default
;       jump address is the address of the next instruction assembled (not,
;       in general, the current location +1).
;       In general, a field corresponds to the set of bits which provide
; select inputs for mixers or decoders, or controls for ALU's.
; Examples:
;       AMX/=0,2,20,D
;       The microcode field which controls AMX is two bits wide
; and the rightmost bit is shown in the listing as bit 20 of the
; microinstruction.  If no value is specifically requested for the field,
; the microassembler will ensure that the field is 0.
;       ALU/=0,4,25
;       The field which controls alu is 4 bits wide, ending on
; bit 25.  The fourth parameter of the field is omitted, so the field
; is avai able to the microassembler (if no value is explicitly
; called out for the field) for modification.
;(2)    Value Definitions
;       Following a field definition, symbols may be created in that
; field to correspond to values of the field.  the form is:
;       SYMBOL=N
;       "N" is, in hex, the value of symbol when used in the field.
; examples:
;       ALU/=0,4,25     ;Field definition in which following symbols exist
;       XOR=7
;       A+B=8
;       Here the symbols "XOR" and "A+B" are defined for the "ALU" field.
; To the assembler, therefore, writing "ALU/XOR" means put the value 7
; into the 4-bit field ending on bit 25 of the microword.  The symbols
; are chosen for mnemonic significance, of course, so one reading
; the microcode would interpret "ALU/XOR" as "the output of ALU shall be the
; exclusive or of its A and B inputs".  Similiarly, "ALU/A+B" is read as
; "ALU produces the sum of A and B".
;       SCK/=0,1,23,D   ;field definition for following symbols
;       NOP=0
;       LOAD=1
;       Here the symbols "NOP" and "LOAD" are defined for the field named
; "SCK", which controls the clocking of the SC register.  We could write
; SCK/NOP in every microinstruction in which we did not want the SC
; to change, but to simplify things, we use the default mechanism, which
; ensures that unless a microinstruction explicitly specifies a change
; to SC (by SCK/LOAD), the assembler will make the value of this field 0.
;
;(3)    Label Definitions
;       A micro instruction may be labelled by a symbol followed by colon
; preceding the microinstruction definition.  The address of the
; microinstruction becomes the value of the symbol in the field named "J".
; example:
;       FOO:    J/FOO
;       This is a microinstruction whose "J" field (jump address) contains
; the value "FOO".  It also defines the symbol "FOO" to be the address
; of itself.  Therefore, if executed by the microprocessor, it would
; loop on itself.
;
;(4)    Comments
;       A semicolon anywhere on a line causes the rest of the line
; to be ignored by the assembler.  This text is an example of comments.
;
;(5)    Microinstruction Definition
;       A word of microcode is defined by specifying a field name,
; followed by slash (/), followed by a value.  The value may be a
; symbol defined for that field, a hex digit string, or a decimal
; digit string (distinguished by the fact that it is terminated by
; a period). Several fields may be specified
; in one microinstruction by separating field/value specifications with
; commas.  example:
;       AMX/LA,BMX/D,ALU/A-B
;       The field named "AMX" is given the value named "LA" (to
; cause the mixer on the A side of ALU to select LA), field "BMX" has value
; "D", field "ALU" has value "A-B".
;(6)    Continuation
;       The definition of a microinstruction may be continued onto two or
; more lines by breaking it after any comma.  In other words, if the
; last non-blank, non-comment character on a line is a comma, the
; instruction specification is continued on the following line.
; example:
;       AMX/LA,BMX/D,           ;Select LA & D as ALU inputs
;       ALU/A-B                 ;Select ALU to perform A-B
; By convention, a blank line and a line of hyphens appears between
; microinstructions, to make it easier for the reader to distinguish
; continuation from separate microinstructions.
;
;(7)    Macros
;       A macro is a symbol whose value is one or more field/value
; specifications and/or macros.  A macro definition is a line containing
; the macro name followed by a quoted string which is the value of the
; macro.  example:
;       D_LA-D          "AMX/LA,BMX/D,ALU/A-B,D_ALU"
; The appearance of a macro in a microinstruction definition is equivalent
; to the appearance of its value.  Macros may have parameters, enclosed in
; square brackets ("[" and "]").  The definition of a macro with parameters
; includes paired brackets to indicate where the parameters should go, and
; uses "@" followed by a decimal digit string to indicate which symbols in
; the macro body should be replaced by the parameters:
```

```
;       RC[]_D+K[]      "AMX/D,KMX/@2,BMX/KMX,ALU/A+B,SPO.RC/@1"
;       This macro indicates that the first parameter (selected by @1)
; should be used as the value in the "SPO.RC" field, and the second parameter
; as the value of the "KMX" field.  A typical use of this macro might
; look like:
;       RC[T1]_D+K[34]
; In this case, the expansion would be  "AMX/D,KMX/34,BMX/KMX,ALU/A+B,SPO.RC/T1"
;  Macros for various functions are defined in "MACRO.MIC".
;
;(8)    Pseudo Ops
;       The micro assembler has the following pseudo-operators:
; .UCODE and .DCODE select the ram into which subsequent microcode will
; be loaded, and therefore the field definitions and macros which are
; meaningful in subsequent microcode.
; .TITLE defines a string of text to appear in the page header, and
; .TOC defines an entry for the table of contents at the beginning.
; .PAGE starts a new page of listing, and creates a .TOC entry if
;       a quoted string follows the pseudo-op.
; .SET defines the value of a conditional assembly parameter,
; .CHANGE redefines a conditional assembly parameter,
; .DEFAULT assigns a value to an undefined parameter.
; .IF enables assembly if the value of the parameter is not zero,
; .IFNOT enables assembly if the parameter value is zero, and
; .ENDIF re-enables assembly if suppressed by the parameter named.
; .RTOL enables bits numbered from 0 on the right of the microinstruction.
; .HEXADECIMAL enables radix to be 16 instead of default radix 8.
; .REGION defines prefered parts of the .UCODE space.
; .CREF and .NOCREF enable and disable the collection of cross-reference
;       information on symbol usage.
; .LIST and .NOLIST enable and disable output listing.
; .BIN and .NOBIN enable and disable leaving room at the left margin
;       for binary output.
; .MACHINE selects microassembler features needed for special microproccessors.
;(9)    Location Control
;       A microinstruction "labelled" with a number is assigned to that
; address.
;       The character "=" at the beginning of a line, followed by
; a string of 0's, 1's, and/or *'s, specifies a constraint on the
; address of following microinstructions.  The number of characters
; in the constraint string (excluding the "=") is the number of low-order
; bits constrained in the address.  The microassembler attempts to find
; an unused location whose address has 0 bits in the positions
; corresponding to 0's in the constraint string and 1 bits where the
; constraint has 1's.  Asterisks denote "don't care" bit positions.
;       If there are any 0's in the constraint string, the constraint
; implies a block of <2**N> microwords, where N is the number of 0's
; in the string.  All locations in the block will have 1's in the address
; bits corresponding to 1's in the string, and bit positions denoted by *'s
; will be the same in all locations of the block.
;       In such a constraint block, the default address progression is
; counting in the "0" positions of the constraint string, but a new
; constraint string occuring within a block may force skipping over
; some locations of the block.  Within a block, a new constraint
; string does not change the pattern of default address progression, it
; merely advances the location counter over those locations.  The
; microassembler will later fill them in.
; 186   ;       A null constraint string ("=" followed by anything but "0",
; 187   ; "1", or "*") serves to terminate a constraint block.
; 188   ; examples:
; 189   ;       =0
; 190   ;       This specifies that the low-order address bit must be zero--
; 191   ; The microassembler finds an even-odd pair of locations, and puts
; 192   ; the next two microinstructions into them.
; 193   ;       =11
; 194   ;       This specifies that the two low-order bits of the address must
; 195   ; both be ones.  Since there are no 0's in this constraint, the
; 196   ; assembler finds only one location meeting the constraint.
; 197   ;       =0*****
; 198   ;       This specifies a pair of addresses, the first having a zero in
; 199   ; the "20" bit, and the second having a one in that position, but all
; 200   ; other bit positions the same.
```

.PAGE   "ID Bus Map"    ;September 2, 1977
.NOBIN
;  The left column lists first the ID bus register name, and in parenthesis
; its address.  If the register is also accessible by MTPR and MFPR inst-
; ructions, the Internal Register Number and symbolic name are also given.

        .PAGE   "TEST 59        ALU TEST"
;*************************************************************
;++
; TEST  59      ALU TEST
;
; TEST DESCRIPTION
;       THIS IS A TEST OF THE DATA PATH ALU. ALL
;       ALU FUNCTIONS ARE TEST EXCEPT A-B AND A+B (WHICH
;       ARE TESTED IN THE HARDCORE) AND THOSE FUNCTIONS
;       WHICH ARE ACCESSABLE ONLY THROUGH THE
;       SELECTION OF INSTRUCTION BUFFER DEPENDENT ALU
;       FUNCTION. TEST PATTERNS ARE GENERATED IN SUCH
;       A WAY AS TO GENERATE EVERY POSSIBLE COMBINATIONS
;       OF A<3:0> AND B<3:0> AND CIN FOR EACH 4 BIT SLICE
;       ALU CHIP.
;       SUBTEST 1 TESTS BEN ALU C31
;       SUBTEST 2 TESTS THE FUNCTION A
;       SUBTEST 3 TESTS THE FUNCTION B
;       SUBTEST 4 TESTS THE FUNCTION NOT.A
;       SUBTEST 5 TESTS THE FUNCTION A.OR.B
;       SUBTEST 6 TESTS THE FUNCTION A.AND.B
;       SUBTEST 7 TESTS THE FUNCTION A.ORNOT.B
;       SUBTEST 8 TESTS THE FUNCTION A.ANDNOT.B
;       SUBTEST 9 TESTS THE FUNCTION A.XOR.B
;       SUBTEST A TESTS THE FUNCTION A-B-1
;       SUBTEST B TESTS THE FUNCTION A+B+1
;       SUBTEST C TESTS THE FUNCTION A-B(RLOG)
;       SUBTEST D TESTS THE FUNCTION A+B(RLOG)
;
; LOGIC DESCRIPTION
;       TESTED HERE ARE ALL THE ALU FUNCTIONS EXCEPT A-B
;       AND A+B (THESE HAVE BEEN TESTED IN THE HARDCORE
;       TESTS) AND THE FUNCTION ONLY ACCESSABLE THROUGH
;       USING AN INSTRUCTION DEPENDENT OPERATION. NOTE THAT
;       ONLY THE RESULT OF A.MINUS.B (RLOG) AND A.PLUS.B (RLOG)
;       ON THE ALU ARE CHECKED. THE RLOG STACK ITSELF IS TESTED
;       LATER.
;       IF A FAILURE OCCURS BECAUSE THE CONTROL LINES WHICH SELECT
;       THE ALU FUNCTION OR THE ALU CARRY IN TO ALU <00> ARE INCORRECT
;       THEN DAP IS AT FAULT. OTHERWISE THE BIT SLICE DATA PATH MODULE
;       WHICH IS INCORRECT IS AT FAULT. THE BIT SLICES ARE DIVIDED THUS:
;               BITS <07:00>    ARE ON DCP
;               BITS <15:08>    ARE ON DDP
;               BITS <31:16>    ARE ON DEP
;       ANOTHER POSSIBILITY, ONLY WHEN EXECUTING AN ALU ADD OR SUB
;       IS THAT THE CARRY LOOK AHEAD LOGIC HAS FAILED. THIS LOGIC IS LOCATED
;       ON THE DCP MODULE.
;
; ERROR DESCRIPTION
;       EXPECTED RESULT
;       GOT RESULT
;       A OPERAND
;       B OPERAND
;       ALU FUNCTION BEING TESTED AS GIVEN BY:
;               OC      A+B **NOT BEING TESTED,BUT USED IN SUBTEST
```

                                        .TOC    "MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
                                .REGION/1000,13FF
                                ;+
                                ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
                                ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[OF].
                                ; R[OF] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
                                ; THIS IS DONE BY SETTING THE BIT IN R[OF] THAT CORRESPONDS TO THE NUMBER
                                ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
                                ;
                                ; FOR EXAMPLE: IF A TEST EXPECTED A "TB MISS" MICRO TRAP IT WOULD SET BIT
                                ;       6 IN SCRATCH PAD R[OF]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
                                ;       ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
                                ;       R[OF] AND DO A RETURN0.
                                ;
                                ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[OF], THE TRAP ROUTINE
                                ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
                                ; TO THE CONSOLE.
                                ;

;++
; TEST  A4      TB WRITE PULSE TEST
;
; TEST DESCRIPTION
;       THIS IS A TEST OF THE TB WRITE PULSE LOGIC, SIMPLE
;       HITS AND MISSES. ALSO TESTED IMPLICITELY IS THE ABILITY
;       THE PARITY CHECKERS AND GENERATORS TO OPERATE CORRECTLY
;       UPON SIMPLE DATA PATTERNS. LOCATION 0 IS USED IN
;       BOTH GROUPS OF THE TB. LOCATION 0 MEANS VA<31>=VA<13:09>=0.
;       NOTE THAT THE FORCE REPLACE BITS
;       IN TBERO ARE USED EXTENSIVELY.
;       THE TEST SEQUENCE IS:
;               1       WRITE (VA=2AAA8000 PTE=A4066666) INTO BOTH GROUPS
;               2       WRITE (VA=4CCCC000 PTE=A4155555) INTO GROUP 0 AND
;                               CHECK WRITE PULSE
;               3       WRITE (VA=55554000 PTE=A4199999) INTO GROUP 1 AND
;                               CHECK WRITE PULSE
;               4       READ (VA=4CCCC000 PTE=A4155555) AND CHECK FOR HIT IN GROUP 0
;               5       READ (VA=55554000 PTE=A4199999) AND CHECK FOR HIT IN GROUP 1
;               6       WRITE (VA=33330000 PTE=A40AAAAA) INTO GROUP 0

;******************************************************************
;++
; TEST  CE      CACHE WRITE PULSE TEST
;
; TEST DESCRIPTION
;       THIS IS A TEST OF THE CACHE WRITE PULSE LOGIC. TESTED HERE
;       WRITE PULSES GENERATED BY CACHE INVALIDATE (USING THE MCT COMMAND)
;       CACHE WRITE VALID (INCLUDING FORCE REPLACE AND RANDOM REPLACE),
;       AND WRITE HITS. ALSO TESTED ARE THE CACHE HIT/MISS BITS IN
;       THE SBI MAINTENANCE REGISTER AND SIMPLE ONES AND ZEROES
;       DATA PATTERNS IN CACHE LOCATION 'ZERO' (PA<11:03>=0) IN BOTH
;       GROUPS.
;       ASSUMING 4 TEST ADDRESS PATTERNS:       A1=19999000
;                                               A2=06666000
;                                               A3=1B6DB000
;                                               A4=04924000
;       AND 4 TEST DATA PATTERNS:       D1=AAAAAAAA
;                                       D2=55555555
;                                       D3=99999999
;                                       D4=66666666
;       THE TEST SEQUENCE OF EVENTS IS:
;               1       INVALIDATE PA=0 IN BOTH GROUPS
;               2       READ ADDRESS 0 AND CHECK FOR MISS IN BOTH GROUPS
;               3       VALIDATE A1 (WITH DATA D1) IN GROUP 0
;               4       VALIDATE A2 (WITH DATA D2) IN GROUP 1
;               5       READ A1, CHECK FOR HIT IN GROUP 0 AND DATA=D1
;               6       READ A2, CHECK FOR HIT IN GROUP 1 AND DATA=D2
;               7       VALIDATE A3 (WITH DATA D3) IN GROUP 0
;               8       READ A1 AND CHECK FOR MISS IN BOTH GROUPS
;               9       READ A3, CHECK FOR HIT IN GROUP 0 AND DATA=D3
;               A       READ A2, CHECK FOR HIT IN GROUP 1 AND DATA=D2
;               B       VALIDATE A4 (WITH DATA D4) IN GROUP 1
;               C       READ A2 AND CHECK FOR MISS IN BOTH GROUPS
;               D       READ A4, CHECK FOR HIT IN GROUP 1 AND DATA=D4
;               E       READ A3, CHECK FOR HIT IN GROUP 0 AND DATA=D3

;               28      READ A4, CHECK FOR HIT IN GROUP 0 AND DATA=D2
;       DONE
;
; LOGIC DESCRIPTION
;       TESTED HERE ARE THE MODULES CAM, CDM AND SBL. IF A CACHE
;       PARITY ERROR IS DETECTED THEN EITHER CAM OR CDM IS AT FAULT.
;       THE CACHE PARITY REGISTER WILL INDICATE WHICH OF THESE
;       TWO MODULES CAUSED THE PARITY ERROR. SBL GENERATES THE
;       CONTROL SIGNALS WHICH RESULT IN CACHE WRITE PULSES. IF A MISS
;       IS DETECTED AT AN ADDRESS WHICH SHOULD BE A HIT, CAM IS AT FAULT
;       IF THE APPROPRIATE HIT SIGNAL IS INCORRECT FROM THAT MODULE;
;       ANOTHER CAUSE FOR THIS SYMPTOM COULD BE A BROKEN SBI MAINTENANCE
;       REGISTER ON THE SBI CONTROL MODULE.
;
; ERROR DESCRIPTION
;       VA REFERENCED
;       EXPECTED CONTENTS OF CACHE MAINT REGISTER (NOTE THAT
;               ONLY THE HIT/MISS AND FORCE MISS AND FORCE REPLACE
;               BITS ARE RELEVANT)
;               OR GOT CACHE PARITY REGISTER IF UNEXPECTED
;               UTRAP OCCURS
;       GOT CACHE MAINT REGISTER
;       EXPECTED READ DATA
;       GOT READ DATA
